EFFECT OF INTERLEUKIN-10 PATHWAY GENES AND DIET ON BEHCET'S DISEASE

A Thesis Submitted to
the Graduate School of Engineering and Science of
İzmir Institute of Technology
in Partial Fulfillment of the Requirements for the Degree of

MASTER OF SCIENCE

in Food Engineering

by
Goncagül ARPAZ

July 2019
İZMİR

We approve the thesis of **Goncagül ARPAZ**

Examining Committee Members:

Assoc. Prof. Dr. Efe SEZGİN
Department of Food Engineering, İzmir Institute of Technology

Prof. Dr. Servet AKAR
Department of Internal Medicine, Division of Rheumatology,
Faculty of Medicine, İzmir Katip Celebi University

Assist. Prof. Dr. Şükrü GÜLEÇ
Department of Food Engineering, İzmir Institute of Technology

16 July 2019

Assoc. Prof. Dr. Efe SEZGİN
Supervisor, Department of Food Engineering
İzmir Institute of Technology

Prof. Dr. Figen KOREL
Head of the Department of
Food Engineering

Prof. Dr. Aysun SOFUOĞLU
Dean of the Graduate School of
Engineering and Science

ACKNOWLEDGMENTS

I would like to express my sincere thanks and appreciation to my supervisor Assoc. Prof. Dr. Efe SEZGİN for his always valuable and positive guidance, patience, encouragement, and understanding. It is a great chance to be his student.

I would like to special thank Gamze TERLEMEZ and Berkay BOZKURT for their help. Also, I would like to thank Hümeyra TAŞKENT SEZGİN for guidance in the genetic laboratory for my first time.

I am always grateful Özge KANTAR, Nagihan BAŞAK, Pınar ŞİRİN and Nazan KOCA for their help, friendship, and support during my graduate years.

I would like to the biggest thank the ARPAZ family for their love, support, and encourage all of my life. I would like to thank my mother Gülser ARPAZ who always supported me for my master's degree. I want to thank H. Mert ÖZTÜRK for his support and faith in me.

… to my father Mehmet ARPAZ

ABSTRACT

EFFECT OF INTERLEUKIN-10 PATHWAY GENES AND DIET ON BEHCET'S DISEASE

Behcet's disease (BD) is an inflammatory disease characterized by recurrent oral and genital aphthae with unknown etiology. The disease is most prevalent along the Silk Road populations. BD is a complex disease influenced by genetic and environmental factors. Identification of contribution of these factors to BD is an active research question.

The first aim of the thesis is to determine the biological pathways in the etiopathology of BD by a comprehensive literature review of published genetic research. The second aim of the thesis is to investigate the genetic changes and gene expression in IL-10, an anti-inflammatory pathway cytokine, and its primary receptor IL-10R1 in BD. The third aim of the thesis is to discover potential novel functional foods that can benefit patients with BD.

241 variants from 119 genes were identified to be associated with BD. Frequency distribution of the 241 variants among world populations was rather different. IL-10 was identified to be the most significantly associated with BD and differentiated high BD risk populations from the rest based on principal component analyses. Sequence analyses of IL-10 and IL-10R1 identified rs3024498 and rs9610 variants, respectively, in Turkish BD patients. Rs3024498 was not associated with BD risk; however, IL-10R1 rs9610 variant showed a marginally significant relationship with BD. IL-10 gene expression was 9.6 fold higher in BD compared to normal controls.

As an anti-inflammatory IL-10 pathway is identified to influence BD, novel food supplements with high anti-inflammatory ingredients need to be developed to benefit patients with BD.

ÖZET

İNTERLÖKİN-10 YOLAĞI GENLERİNİN VE DİYETİN BEHÇET HASTALIĞI'NA ETKİSİ

Behçet Hastalığı (BH) 1937 yılında Hulusi Behçet tarafından tanısı konan enflamatuvar bir hastalıktır. Hastalık ağız ve genital bölgede tekrarlayan aftlarla ortaya çıkar ve diğer organ ve sistemleri de etkiler. İpek Yolu üzerindeki ülkelerde daha çok görüldüğü için "İpek Yolu Hastalığı" da denilmektedir. En çok görüldüğü ülkeler sırasıyla Japonya, Kore, Çin, İran ve Türkiye'dir. Hastalığın nedeni tam olarak bilinmemekle birlikte genetik ve çevresel faktörlerin etkileşimine dayanan karmaşık bir hastalık olduğu kabul edilmektedir. Bu faktörler hastalığın aydınlatılmasında önemlidir.

Tezin ilk amacı, BH etyopatolojisinde yer alan biyolojik yolları yayınlanmış genetik çalışmalar ile tespit etmekti. Tezin ikinci amacı, IL-10 ve birincil reseptörü IL-10R1'deki genetik değişiklikleri ve gen ekspresyonunu araştırmaktı. Üçüncü amaç ise hastalar için anti-enflamatuar gıdaları bir araya getiren fonksiyonel gıda fikirleri ortaya koymaktı.

BH ile ilişkili olarak 119 genden 241 varyant tespit edildi. Bu 241 varyantın dünya popülasyonları arasındaki frekans dağılımı oldukça farklıydı. IL-10 geninin BH ile en anlamlı ilişkiye sahip olduğu ve ana bileşen analizlerine göre yüksek riskli Behçet popülasyonlarını diğerlerinden ayırt edebildiği tespit edildi. Türk Behçet hastalarında IL-10 ve IL-10R1'in dizi analizleri sırasıyla rs3024498 ve rs9610 varyantlarını tanımladı. Bu çalışmada IL-10 rs3024498 varyantı BH ile ilişkili değildi. Bununla birlikte, IL-10R1 rs9610 varyantı, BH ile çok az anlamlı bir ilişki gösterdi. Behçet hastalarında IL-10 gen ekspresyonu kontrollere göre 9,6 kat daha yüksekti.

Behçet hastalarına fayda sağlamak için, yüksek anti-enflamatuar içerikli yeni besin takviyelerinin geliştirilmesi gerekmektedir.

CHAPTER 1

INTRODUCTION

1.1. Behcet's Disease

Behcet's disease is an inflammatory disease of unknown etiology which is mainly characterized by oral and genital ulcers, uveitis and skin lesions. It affects on vascular, gastrointestinal, and neurological systems also joints.[1]

Hulusi Behçet is a Turkish dermatologist, described three symptoms with oral and genital ulcerations and hypopyon uveitis in 1937.[2] However back in the 1930's Greek Benediktos Adamantiades recognized similar clinical features. Even so he did not classify them as a new disease.[3]

Even going back as early as the 5th century BC the father of medicine Hippocrates in fact mentioned patients with clinical features which we may call today as BD. But Hulusi Behçet was the first international recognized doctor to classify is a new disease in the literature.[1]

1.2. Epidemiology

BD is mostly seen along the Silk Road which is an ancient trading route between the Mediterranean and East Asia.[4]

The highest prevalence is seen in Japan, Korea, China, Iran and Turkey. However, because of immigration, the prevalence has increased in the other parts of the world. The represented prevelances are in Germany 4.2, in France 7.2, and in the US 8.6 per 100 000 inhabitants. Besides that, BD has the highest prevalence in Turkey from 80 to 420, and in Iran from 80 to 100, in Japan 13.5, in China 14 per 100 000 inhabitants.[5-6] Distribution of the highest cases of BD in Turkey is shown in Figure 1.1.

The age of onset is 20-40 in adulthood and is rarely seen in childhood. The ratio of women and men is almost the same.[7]

In different studies conducted in Turkey, it has been shown that early age and male sex are associated with more severe disease course. Although mostly seen in women in Korea, a more severe disease course is observed in males.[8]

Figure 1.1. Distribution of the highest cases of BD in Turkey

1.3. Pathogenesis

The etiology of BD is still obscure; however, it seems to be a complex disease based on the interaction between the genetic background and the environment.[9]

As a genetic background, BD has MHC class I associations. HLA-B51 is the most strongly associated known genetic factor to BD. However, even in familial cases, it accounts for less than 20% of the genetic risk, indicating that other genetic factors continue to be discovered.[10]

In recent years, there have been intense opinions about the efficacy of infectious agents as an environmental factor in triggering and developing the disease. Herpes simplex type I virus, some streptococcus strains (*S. pyogenes, S. oralis, S. sanguis, S. faecalis, S. salivarus*), hepatitis A, B, C, E viruses, *Helicobacter pylori*, parvovirus B19, borelia burgdorgferi, mycobacteria are some of the most prominent infectious agents. The common feature of these infectious agents is the similarity of their antigenic structures. Although infectious agents have been shown to be histopathologically and statistically involved in the pathogenesis of BD, none of these infectious agents have been isolated and proven to be the cause of BD. The general view today is that BD is

not a direct disease caused by infection. However, it may be due to immune dysregulation caused by viral or bacterial antigens.[8, 11]

1.4. Clinic

Clinical manifestations are oral aphtha, genital aphthae, skin lesions, pathergy test, ocular, musculoskeletal system, central nervous system, vascular lesions, gastrointestinal system.[12-13]

1.4.1. Oral Aphtha

Oral aphtha is the most frequent symptom. It is found in almost every patient. Aphthae are often the first symptom of the disease. BD begins with aphthous ulcers with recurrence in the oral mucosa in 99% of cases. Aphthae can usually repeat once or several times a month. It is frequently seen in the buccal mucosa, tongue, gum, and soft palate.[13]

Figure 1.2. Oral aphtha (Source: Wozniacka et al.[4])

1.4.2. Genital Aphthae

Genital aphthae are seen in 60-90% of cases and are a very frequent symptom of BD. They are localized in men on the scrotum, less frequently on the penis or in the

urethra and in women on the vulva and vagina where they can be extensive and painful.[14]

They are morphologically similar to oral ulcers, but are usually larger and deeper, heal with scarring and wounds are specific to BD. [2, 8]

Figure 1.3. Genital apthea (Source: Hatemi et al.[15])

1.4.3. Skin Lesions

The most common skin manifestations are pseudofoliculitis and erythema nodosum-like lesions. Unlike acne vulgaris, pseudopholliculitis and acneiform nodules can occur all over the body and are not always associated with hair follicle.[2]

Figure 1.4. Deep wound on the leg (Sources: Hatemi et al. and Mat et al.[15-16])

1.4.4. Pathergy Test

Another important finding of Behcet's disease is the pathergy phenomenon. A positive pathergy test is considered to be the only diagnostic test currently available for BD. It is an important component of many of the 16 classification criteria used to diagnose BD.[4]

It is applied to the hairless area of forearm skin. Twenty gauge needles are placed obliquely along the dermis. After 48 hours, the development of papules and pustules is considered a positive result, are shown in Figure 1.5.

Figure 1.5. Pathergy phenomenon (Sources: Mat et al.[16])

The rate and intensity of pathergy positivity in young male Behçet's patients can be high.[16] Pathergy positivity is observed around 60% of Turkish and Middle East cases and in 44% of Japanese cases, but it is not seen as frequently in the cases living in England and America.[13]

1.4.5. Ocular

Ocular disease is the first symptom in approximately 20% of cases. It can be seen in 28-80% of all patients with BD.[4] Male patients are more likely to develop eye

disease at younger ages and have a higher risk of visual loss in long-term follow-up. Eye involvement in BD includes a broad spectrum of symptoms. In most cases, ocular symptoms follow oral and genital ulcers by 3-4 years.[17]

1.4.6. Musculoskeletal System

Arthritis and arthralgias are seen in half of the patients as a joint involvement and are common in male patients. These arthritis attacks typically resolve spontaneously within a few weeks. The knees are the most commonly affected joints, followed by the ankle, wrist, elbow, and hip.[18]

Patients with Behçet's disease and arthritis also have more acne lesions. Fibromyalgia may be associated with Behçet's disease, especially in female patients. Local and generalized myositis is rare in Behçet's disease. Another rare manifestation is aseptic necrosis of the bones.[16]

1.4.7. Vascular Lesions

Vascular involvement is important because of severe morbidity and increased mortality. Vasculitis of small and large vessels may cause various symptoms depending on the location of the lesions. The arterial disease mainly affects males and rarely occurs in women.[4] Studies performed in the last years confirmed that chronic and multisystemic vasculitis play a key role in BD pathogenesis. It was confirmed by elevated serum levels of several cytokines, such as IL-1, IL-4, IL-6, and TNF-α, which are responsible for the inflammatory reaction.[19]

1.4.8. Central Nervous System

It is usually found in male patients at early ages and in 10-20% of cases. Meningitis, meningoencephalitis, cranial nerve palsies and neurologic symptoms can be seen. Stressful life and psychiatric problems both increase exacerbations and facilitate the development of other symptoms. [8]

1.4.9. Gastrointestinal System

Gastrointestinal involvement in BD can be seen in all regions from the mouth to the anus. Gastrointestinal involvement is most frequently observed in ileocecal region and colon. The incidence rate is different in different countries. While gastrointestinal involvement occurs in 50-60% of Japanese and 38-50% of British patients, it is seen rarely (0-5%) in Turkey, Saudi Arabia, and Lebanon.[20]

1.5. Other Manifestations

Psychiatric changes and depression can be observed in at least 50% of cases, especially during active periods.[13] BD patients can also have neurologic problems such as fatigue, sleep disorder, anxiety, depression and severe headache which further reduce the quality of life in these patients.[21] Pregnancy does not significantly change the activity of the disease.[22] Pulmonary, cardiac and renal involvement is relatively rare.[4] Mortality is more common in young male patients. Major vasculature problems, neurological involvement, and pulmonary artery aneurysm are the causes of death.[23]

1.6. Diagnosis

There is no definitive method for the diagnosis of BD but it is more clinically diagnosed. One of them is The International Study Group (ISG) criteria for BD which is created in 1990. The recurrent oral ulceration is mandatory, and two of, genital ulcerations, ocular disease, skin lesions, and a positive pathergy test are necessary to classify a patient as having BD.[24]

On the other hand as a result of the weaknesses of the ISG criteria, The International Criteria for Behcet's Disease (ICBD) were presented to the International Conference of Behcet's Disease in Lisbon (Portugal) in 2006.[25] Newly formed criteria included oral aphthosis, genital aphthosis, ocular lesions (anterior uveitis, posterior uveitis, or retinal vasculitis), neurological symptoms, skin lesions (pseudofolliculitis, skin aphthosis, erythema nodosum), and vascular symptoms (arterial thrombosis, large vein thrombosis, phlebitis or superficial phlebitis). While 2 points were given to each of the oral aphthae, genital aphthous and ocular lesions, 1 point was given to each of the

skin lesions, vascular findings and neurological symptoms. A patient who scored 4 points or more was classified as having BD (Table 1.1.).[26]

Table 1.1. International Criteria for Behcet's Disease – point score system: scoring ≥ 4 indicates Behcet's diagnosis

Sign/Symptom	Points
Oral aphthosis	2
Genital aphthosis	2
Ocular lesions	2
Skin lesions	1
Neurological symptoms	1
Vascular symptoms	1
Positive pathergy test	1*

* The Pathergy test is optional and the primary scoring system does not include the pathergy test. However, when a pathergy test is performed, an additional score can be assigned for a positive result.

1.7. Treatment

BD is a condition that typically runs a relapsing and remitting course, and the aim of treatment is to immediately suppress inflammatory exacerbations and recurrences to prevent irreversible organ damage. Immunosuppressives are usually necessary to succeed this. Treatment should be individualized according to age, gender, type and severity of organ involvement and patients' preferences. In patients with BD, skin, mucosa and joint involvement can cause impairment of quality of life but do not cause permanent damage whereas untreated eye, vascular, nervous system and gastrointestinal system involvement can cause serious damage and even death.[27]

1.8. Genetics

The widespread distribution in a particular geographical region, the close association with HLA-B51 in different ethnic groups, and the familial aggregation of BD are strong signs in the genetic background of BD.[28]

1.8.1. Geoepidemiology

Although widespread environmental factors are thought to contribute to BD, it is believed that the development of the disease occurs only in genetically predetermined hosts. The broad disease prevalence observed between different geographical regions is probably the result of differences in both the environment and genetics. Differences in disease prevalence among recent migrants represent a role of the environment compared to those living in their own country, while the prevalence of disease among individuals of different ancestors in the same region reflects the genetic role in disease predisposition.[6]

1.8.2. Familial Aggregation

BD does not have a Mendelian inheritance pattern and usually occurs sporadically. Familial aggregation and a higher prevalence in siblings and parents, and monozygotic twins concordant of BD patients have been observed.[17]

Familial aggregation of BD varies among populations. In Turks 18.2%, Koreans 15.4%, and Jews 13.2% familial aggregation is higher than in the Chinese 2.6%, Japanese 2.2%, and various European populations 0-4.5%.[6]

1.8.3. MHC Region

Major histocompatibility complex (MHC) molecules or human leukocyte antigens (HLA) are the cell surface molecules responsible for antigen presentation and activation of T cells and also that help the immune system recognize foreign substances.[29]

1.8.3.1. HLA-B51

Analysis of the Japanese population in 1973 was the first evidence of BD associated with human leukocyte antigen (HLA) class I (HL-A5) in major histocompatibility complex (MHC). The risk allele was later renamed as HLA-B51.[30]

HLA-B51 is the strongest association finding with BD, and it has been repeated in several different ethnic groups.[31] A meta-analysis study shows that the contribution of HLA-B51 varies from 32% to 52% according to geographical area.[32]

In a Genome-wide association studies (GWAS) conducted in Turkey, 1215 BD patients, and 1278 healthy controls, HLA-B51 variant was found in 59.1% in the BD patients and 29.3% in the control group, thus a strong relationship was demonstrated between HLA-B51 and BD.[33]

1.8.3.2. Other MHC Class I Genes

A study in Turkey evaluated the relationship of HLA class type I with BD and the control group and found that the HLA-B51, -B15, -B27 regions were associated with the risk of developing BD; whereas the HLA-A03 and -B49 regions are associated with a protective role against disease.[34]

The MHC Class I gene-related gene (MICA) is often thought to be one of the candidate genes for the susceptibility towards BD.[35] In the meta-analysis, it was found that the MICA-transmembrane (TM) A6 allele was associated with a susceptibility to disease development among European and Asian populations, whereas MICA-0009 was associated with only the European population, and that MICA alleles are in strong linkage disequilibrium (LD) with HLA-B51 in BD.[36] In another meta-analysis of the MICA-A6 allele, the MICA-A6 allele was more frequently observed in BD than in the control group, especially in Asians and Caucasians. It is also suggested that it may serve as an early diagnostic marker.[37]

1.8.3.3. HLA Association with Disease Manifestations

Studies have reported an association between MHC class I alleles and some clinical manifestations of the disease.[38]

A meta-analysis reported a moderate correlation between HLA-B51/B5 with the male gender, the high prevalence of eye involvement, skin involvement, genital ulcers, and low prevalence of gastrointestinal involvement. This analysis was only found in studies conducted in Asia and Europe, but not the Middle East or North Africa.[39]

Another study reported that in Korean BD patients there is a relationship between HLA-B51 and early-onset uveitis, and high prevalence of the development of posterior uveitis with HLA-A26.[40] On the other hand, another study reported that HLA-A2601 was associated with eye involvement in BD independently of HLA-B5101 and that HLA-A2601 might be a possible predictor of poor visual prognosis in Japanese BD patients.[41]

HLA-A02:07, -A26:01 and -A30:04 were associated with skin lesions and arthritis, with uveitis, and with vascular lesions, genital ulcers, and a positive pathergy test, respectively, by a meta-analysis of the Korean and Japanese populations.[42]

1.8.3.4. Non-MHC Complex Genes

GWAS revealed a significant association between the interleukin (IL)-23R-IL12RB2, IL-10, signal transducer and activator of transcription 4 (STAT-4), chemokine C-C motif receptor 1 and 3 (CCR1-CCR3), killer cell lectin-like receptor K4 (KLRC4), endoplasmic reticulum aminopeptidase 1 (ERAP1), tumor necrosis alpha-induced protein 3 (TNFAIP3), fucosyltransferase 2 (FUT2), the class II major histocompatibility complex transactivator (CIITA), interferon regulatory factor 8 (IRF8), REL, NOD1, GTPase of the immunity-associated protein 1,2,4 (GIMAP1,2,4), nuclear receptor coactivator-5 (NCOA5), forkhead box P3 (FOXP3), psoriasis susceptibility 1 candidate 1 (PSORS1C1), ubiquitin-associated domain containing 2 (UBAC2), small ubiquitin-like modifier 4 (SUMO4), ADO-EGR2, CEBPB-PTPN1, and JRKL/CNTN5 loci and BD. Several GWAS studies in Turkish patients reported that IL-10, IL23R-IL12RB2, CCR1, KLRC4, IL-12A, STAT4, ERAP1, MEF4, NOD2, TLR4, FUT2 were disease susceptibility loci.[43-46]

The genes identified are involved in both innate and adaptive immunity and support the idea that polarization in the Th1 / Th17 pathway plays a critical role in the pathogenesis of BD.[6]

Biological pathways that these genes are functioning is shown in Figure 1.6. MHC/ HLA region is responsible for recognizing the environmental factors such as pathogens and foods. Typically the HLA-B51 gene triggers inflammation. There are several inflammatory pathways involved here. IL-10 is the only anti-inflammatory pathway that can block the initiation of the inflammation.

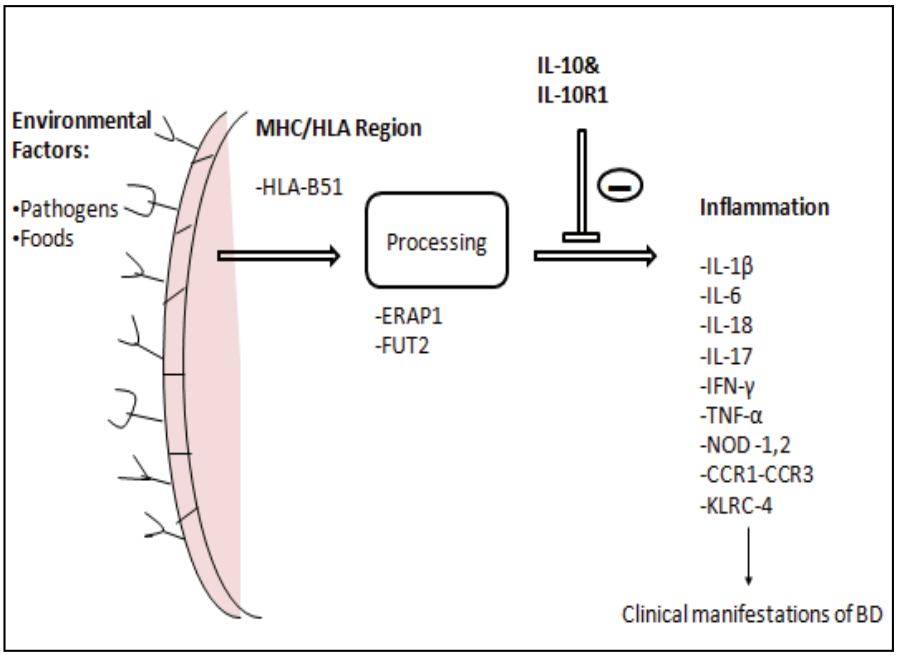

Figure 1.6. Biological pathways of various genes

1.8.4. Cytokines

Cytokines are low molecular weight polypeptides involved in cell communication and function in a number of different immunological mechanisms.[47] Cytokines are involved in almost in all areas of immunity and inflammation; in fact, numerous cytokines have both pro-inflammatory and anti-inflammatory potential.[48] Pro-inflammatory cytokines are IL-1β, IL-6, TNF-α, and IL-17.[49-50] The major anti-inflammatory cytokines are the IL-1 receptor antagonist, IL-4, IL-10, and IL-13.[49] Cytokines play critical roles in the pathogenesis of BD, which were mainly investigated in sera, biologic fluid (e.g., plasma, synovial fluid), or cell supernatants of cultured peripheral blood mononuclear cells from patients with BD.[51]

IL-6 is a key cytokine in BD because it plays a role in the differentiation of $CD4^+$ T cells into Th17 cells. Other cytokines thought to play a role in the pathogenesis of BD are IL-10, a potent suppressor of inflammatory cytokines, IL-12, a potent immune-regulatory cytokine, IL-18, a pro-inflammatory cytokine.[47]

1.8.4.1. IL-10 and IL-10 Receptor

Interleukin-10 (IL-10) is a Type II cytokine and is part of a family of cytokines comprising IL-19, IL-20, IL-22, IL-24, IL-26, IL-28 and IL-29.[48] IL-10 is an anti-inflammatory cytokine that is incorporated in many immune-mediated inflammatory diseases.[52-53]

IL-10 is secreted by a variety of cells, including monocytes, macrophages, dendritic cells, T cells, B cells, granulocytes, epithelial cells, keratinocytes, and mast cells.[54]

IL-10 limits the secretion of pro-inflammatory cytokines, such as TNF-α, IL-1, IL-6 and IL-12, and provides protection against excessive immune responses and tissue damage by controlling pro-inflammatory events. It inhibits the secretion of Th1 cytokines such as IL-2 and interferon- γ (IFN- γ) and controls the differentiation and proliferation of macrophages, T cells and B cells.[55]

In two GWAS study, rs1518111 [33], rs1800872, and rs1800871 [56] were listed as risk genes of BD located in the promoter region of IL-10. The Behçet's disease–associated IL-10 SNP identified in the Turkish population is rs1518111.[33]

IL-10 mediates its anti-inflammatory effects by the signals associated with IL-10R emanating from the cell surface. The IL-10 receptor consists of two subunits, IL-10-R1 and IL-10-R2, which are members of the interferon receptor (IFNR) family. IL-10R1 subunit is unique to IL-10 signaling, but the IL-10R2 subunit is shared by other cytokine receptors, including IL-22, IL-26, and IFN- γ.[57] Whereas IL-10R1 has a dominant role in ligand binding and signal transduction, IL-10R2 is involved in the initiation and transduction of the signal.[58]

Stimulation of IL-10 receptor complex leads to the activation of Janus kinase 1 (JAK1) and tyrosine kinase 2 (Tyk2) and phosphorylation of signal transducer and activator of transcription (STAT) 1, 3, and also 5 which translocate to the nucleus and induce gene expression.[58]

STAT3 is activated by IL-10 receptor signaling and is required for the anti-inflammatory properties of IL-10 and also is critical for IL-10 receptor signaling and could suggest a positive feedback mechanism.[52] STAT3 has also been linked to the regulation of the IL-10 gene through several different signal pathways, including IFN-α.[59]

Interleukin-10 is an anti-inflammatory immunemodulatory cytokine that regulates immune homeostasis especially in the intestine, indicating that the intestine is highly vulnerable to disturbances of immunological balance.[55, 60] The loss of function mutations in the IL-10 or IL-10R gene cause severe early-onset Inflammatory Bowel Disease (IBD) in humans and loss of IL-10 signaling significantly impairs life.[55] Figure 1.7. illustrates suppression of local inflammation in a colon cell.

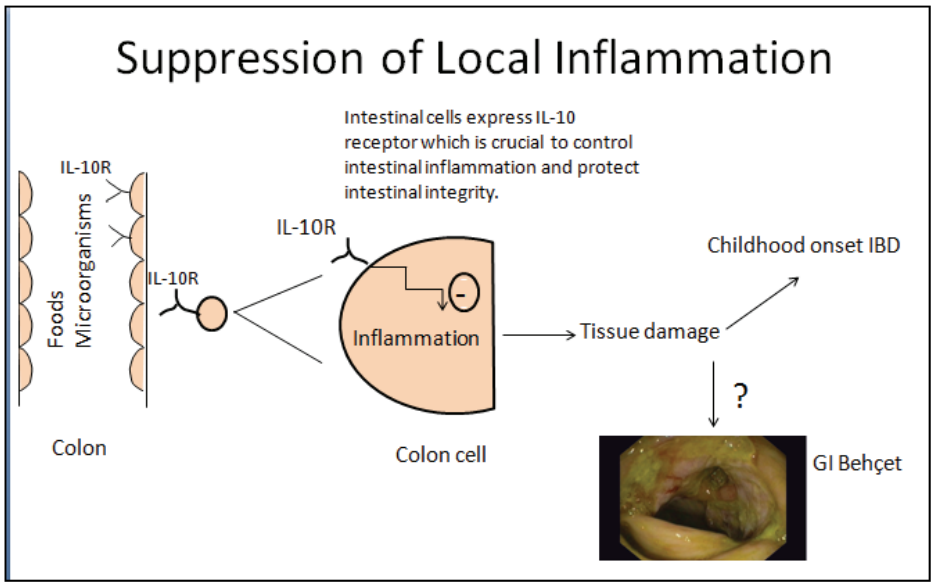

Figure 1.7. Suppression of local inflammation

1.9. Inflammation and Diet

Inflammation is typified by redness, swelling, heat, and pain which are part of the body's immediate response to infection or injury.[61]

Prostaglandins (PG) play an important role in the formation of inflammatory response.[62] Cyclooxygenase (COX) is the key regulatory enzyme of PG biosynthesis, in particular, PGE_2.[63] While COX-1 from two COX isoforms is expressed everywhere and every time in most tissues, COX-2 is generally activated by specific cellular stimuli during inflammation.[50] Inflammation refers to a group of stimuli known to induce COX-2, such as bacterial lipopolysaccharide (LPS), tumor necrosis factor (TNF-α) and cytokines, interleukin-1 (IL-1) and interleukin-2 (IL-2).[63] TNF-α stimulates the production of other pro-inflammatory immune cytokines including IL-1β, IL-6, and INF- γ.[64]

Depending on the cell type in several tissue systems by binding to specific sequences in the genome, the nuclear factor kappa-B (NF-κB) has the capability to firmly regulate and coordinate different changes in gene expression. Components of natural food products inhibit NF-κB activities that coordinate gene expression to advance the inflammatory cascade.[50]

Nitric oxide (NO) can not be precisely defined as an anti-inflammatory or pro-inflammatory molecule but can be considered a true inflammatory agent. The role of inducible nitric oxide synthase (iNOS) in the inflammatory process appears to be dominant.[65]

Reactive oxygen species (ROS) have an important role in responding to damaged lipid membranes, critical cellular proteins, and DNA by activating more stress signals, advancing inflammatory pathways.[50] The antioxidants show their effect by inhibiting the formation of ROS and cleaning the ROS.[66]

Agents derived from plants capable of modulating the expression of pro-inflammatory signals include flavonoids, terpenes, quinones, catechins, alkaloids, anthocyanins, and anthoxanthins, all of which are known to have anti-inflammatory effects.[67]

From ancient times, several natural foods have shown that they can regulate anti-inflammatory responses, and furthermore some clinical studies are carried out to verify the efficacy of these chemical compounds in various natural foods aimed at inflammatory diseases. Besides there are so many natural foods that offer anti-inflammatory actions by elevating antioxidant properties to prevent susceptibility to disease.[50]

1.9.1. Polyphenols

Polyphenols are widespread in plant foods (vegetables, cereals, legumes, fruits, nuts, etc.) and beverages (wine, cider, beer, tea, cocoa, etc.). In general, polyphenols provide a wide variety of anti-inflammatory effects, including antioxidant properties.[68]

1.9.1.1. Flavonoids

The flavonoids, whose numbers are estimated to be over 4000, are abundant in tea, apple, onion, legumes, tomatoes and red wine. Flavonoids have antioxidant properties, also anti-inflammatory, antiviral, antiallergic and antithrombotic properties.[69] Flavonoids show anti-inflammatory properties by inhibition of phospholipase-A_2, cyclooxygenase, lipoxygenase enzymes.[70]

The flavonoids with proven antioxidant effect include green tea, bitter chocolate, red wine, strawberries, raspberries, blackberries and broccoli.[71]

Flavonols:

Isorhamnetin is a dietary flavonoid, found in apples, blackberries, and pears and it is also a major plasma metabolite of quercetin.[72-73] Isorhamnetin has anti-inflammatory and antioxidant properties.[74]

Colorful onion varieties contain more flavonoid than white. External dry shells have been shown to contain quercetin.[70] Quercetin is the most consumed flavonoid and found in fruit, vegetables, cereals, leguminous plants, fruit juices, tea, and wine.[75] Quercetin exhibits a large number of beneficial effects that inhibit NF-κB, COX-2 and ROS. [50]

Animal studies have shown that quercetin is protective in the context of colitis and arthritis varieties.[50, 76] Quercetin inhibits the inflammatory aspects of synovial cell function, neutrophil activation and proliferation of different cancer cell types.[76]

Kaempferol is present in many edible plants such as broccoli, cabbage, kale, beans, endive, leek, tomato, strawberries, and grapes, and in plants or botanical products commonly used in traditional medicine (e.g. *Ginkgo biloba, Tilia spp, Equisetum spp, Moringa oleifera, Sophora japonica*, and propolis).[77] Countless preclinical studies have shown that kaempferol, including, antioxidant, anti-inflammatory, anticancer, antimicrobial, antidiabetic, anti-osteoporotic, estrogenic/antiestrogenic, anxiolytic, analgesic, and antiallergic activities, and cardioprotective, and neuroprotective activities.[78] The anti-inflammatory effects of kaempferol on NF-κB activity and its related gene expressions in the presence of oxidative stress in aged kidney were explained.[79]

Gingerol, shogaol, and other structurally related substances in ginger inhibit prostaglandin and leukotriene biosynthesis by suppression of 5-lipoxygenase or prostaglandin synthetase. In addition, they can inhibit the synthesis of pro-inflammatory

cytokines such as IL-1, TNF-α, and IL-8.[80-81] Shogaol can down-regulate inflammatory iNOS and COX-2 gene expression.[82]

Flavanols (Catechins):

Catechin is present in apples, blueberries, gooseberries, grape seeds, kiwi, strawberries, green tea, red wine, beer, cacao liquor, and chocolate, cocoa.[83] Flavanols are represented by the antioxidants found in tea epigallocatechin (EGC) and epigallocatechin gallate (EGCG).[50] Epigallocatechin gallate (EGCG) which exists in green tea inhibits COX-2 and PGE_2.[84]

Flavanones:

Flavonones are found in tomatoes and certain aromatic plants such as mint, but they are present in high concentrations only in citrus fruit.[75] Flavanones show strong antioxidant and radical scavenging activity and also exhibit antiviral, antimicrobial, and anti-inflammatory activities.[85] Hesperidin inhibit expressions of COX-2 and IL-8 mRNA in hepatic tissue [86] and naringenin downregulates TNF-α, iNOS, and COX-2 too.[87]

Flavones:

Flavones are found in chamomile, parsley, tea, rosemary, oregano, wine, kiwi, spinach, lettuce, broccoli, grapefruit, cereal and legumes.[88] Flavones have anti-inflammatory and anti-microbial activities which by regulate the Toll receptor (TLR)/NF-κB axis. Also, flavones have anti-oxidant activities, based on the ability of compounds to scavenge ROS.[89]

Isoflavones:

Isoflavones are mainly found in soybeans, soy foods, and legumes.[90] Genistein down-regulates cytokine-induced signal transduction events in immune system cells, so that isoflavones are considered an anti-inflammatory agent.[91] Inhibiting the production of IL-1β, IL-6, IL-12, and TNF-α is the main mechanism by which isoflavones exert anti-inflammatory functions.[92]

Anthocyanins:

Anthocyanins are found in colored fruits such as berries, cherries, peaches, grapes, pomegranates, and plums as well as many dark-colored vegetables such as blackcurrant, red onion, red radish, black bean, eggplant, purple corn, red cabbage, and purple sweet potato.[93-94] Anthocyanins have antioxidant, anti-inflammatory, anticarcinogenic and, antimicrobial activity and have properties such as improvement of eye vision, control of diabetes and, prevention of obesity and cardiovascular diseases.[95]

They show antioxidant activities which by scavenging free radicals, downregulation of cell proliferation and apoptosis and thus reducing oxidative stress and lipid peroxidation.[96]

Proanthocyanidins:

Proanthocyanidins are naturally occurring and are frequently seen in fruits, vegetables, nuts, seeds, flowers and tree bark. Proanthocyanidins are associated with a number of biological activities such as anti-inflammatory, antioxidant, anticancer, antimicrobial, and antiallergic, hypertension prevention, asthma prevention and cardioprotective effect.[97]

Proanthocyanidins have anti-inflammatory effects through ROS scavenging and inhibition of the NF-κB pathway. [98]

1.9.1.2. Lignans

The lignans are found in the highest concentrations in flax and sesame seeds, and in lower concentrations in grains, other seeds, fruits, and vegetables (asparagus, grapes, kiwi fruit, lemons, oranges, pineapple) and wine, coffee and tea.[99] Lignans have phytoestrogenic properties, free radical scavenging activities, and antimicrobial and anti-inflammatory effects, and immunosuppressive activities.[100-102] In one study, pinoresinol (PINO) exhibited the strongest anti-inflammatory properties by reducing IL-6, MCP-1, and COX-2–derived PGE_2 secretions in Caco-2 cells.[103]

1.9.1.3. Phenolic Acids

Hydroxycinnamic acids are found in blueberry, kiwi, cherry, plum, aubergine, apple, pear, chicory, artichoke, potato, corn flour, flour (wheat, rice, and oat), cider, and coffee.[75] Caffeic and sinapic acid exhibit immunomodulatory, anti-inflammatory, antimicrobial, anti-carcinogenic, nephroprotective activity against lipid peroxidation and tissue damage.[104-105] Curcumin in turmeric modulates the inflammatory response by down-regulating the activity of COX-2, lipoxygenase, and iNOS enzymes; and also inhibit the production of inflammatory cytokines, TNF-α, IL -1, -2, -6, -8 and -12.[106-107]

Hydroxybenzoic acids are found in blackberry, raspberry, black currant and strawberry.[75] Salicylic acid shows the anti-inflammatory effect through inhibition of

PGE_2 synthesis.[108] Ellagic acid and gallic acid which isolated from pomegranate potentially inhibited LPS-induced NO, PGE_2, and IL-6 production.[109] Additionally, syringic acid exhibits strong antioxidant, antiproliferative, antiendotoxic, antimicrobial, anti-inflammatory, and anticancer effects.[110-111]

1.9.1.4. Stilbenes

Stilbene compounds occur in cocoa, grape, hop, peanut, strawberry, sugar cane, tomato, bilberry, wines, and berries.[112] The anti-inflammatory functions of stilbenes are mediated by COX enzymes as well as Toll-like receptor 4 (TLR4).[113-114] Resveratrol exhibits anti-inflammatory effects via inhibiting enzymes such as COX-1 or COX-2, as well as the inhibitory effect on transcription factors such as NF-κB or AP-1.[115]

Pterostilbene inhibited mitogen-activated protein kinase (MAPK) activation and the production of pro-inflammatory cytokines IL-6 and TNF-α.[116] Both resveratrol and pterostilbene exhibit antioxidant activity through reducing ROS production and scavenging free radicals.[117]

1.9.1.5. Quinones

Quinones show anti-inflammatory and antioxidant effects. Hypericin is found in St. John's wort that inhibits COX- 2 and NF-κB pathway. Anthraquinone also inhibits ROS and COX-2.[50]

1.9.2. Terpenoids

Monoterpenoids

Most of the monoterpenes are volatile in nature and have been found to be more than 1000 in natural products.[118] Aucubin, catalposide, genipin, α-pinene inhibit the activation of the NF-κB system in inflammatory models.[119-122] Genipin also could inhibit the expression of iNOS and NO production.[121]

Sesquiterpenoids

Parthenolide is found in abundance in the medicinal plant feverfew (*Tanacetum parthenium*) which is the herb is a popular remedy for a migraine and some inflammatory diseases, such as arthritis.[123] Parthenolide has shown that anti-inflammatory response through inhibition of NF-κB signaling.[124]

Costunolide isolated from *Magnolia grandiflora* inhibits the basic inflammatory signaling pathway induced by LPS by inhibiting NF-κB activation and downstream gene expression.[125] Sesquiterpenoids are potent NF-κB-dependent anti-inflammatory compounds.[118]

Diterpenoids

Diterpenoids are found in various plants, including rosemary, ginkgo and various Chinese roots.[126] Carnosol shows anticancer, anti-inflammatory and antioxidant activity through inhibition of NF-kB signaling.[127] Kahweol and cafestol isolated from the beans of *Coffea arabica* and they can inhibit inflammatory responses in macrophages.[128-129] Similarly, tanshinone IIA, andalusol, ginkgolides inhibit NF-κB signaling and inflammatory responses.[130-132]

Triterpenoids

Triterpenoids are found in apples, cranberries, rosemary, oregano, prunes, mango, carrot, cucumber, and soybean.[50] Boswellik acid is a potent anti-inflammatory with various effects ranging from COX-2 inhibition to reducing ROS formation.[133] Betulinic acid downregulates NF-κB-dependent gene expression.[134] Lupeol has anti-inflammatory, antimutagenic and antioxidative activities as well as inhibitory potential against prostaglandin (PGE_2) and cytokine production.[135] Ginsenosides being used in inflammatory diseases, cancer and neurodegenerative disorders. Ginseng and ginsenosides directly or indirectly inhibit the NF-κB signal.[136]

Tetraterpenoids (Carotenoids)

Lycopene is found in tomato, watermelon, pink grapefruit, rosehip and papaya and giving them the color is the most important carotenoid.[137] The antioxidant properties of lycopene come from a single oxygen scavenger, scavenging function and hence protecting the cells against oxidative stress.[138] Lycopene also can inhibit nuclear localization and DNA binding of NF-κB complex, as well as reducing macrophage activation.[139]

β-Carotene is present in red palm oil, palm fruits, leafy green vegetables, carrots, sweet potatoes, mature squashes, pumpkins, mangoes, and papayas.[50] β -Carotene has been reported to suppress LPS-induced expression of iNOS, COX-2, TNF-α and IL-1β expression and the DNA binding of NF-κB complex.[140]

Lutein is found in plenty of green vegetables such as spinach, cabbage but also in egg yolks.[97] Lutein is a potent antioxidant and inhibits inflammatory processes including NF-κB activation and subsequent up-regulation of inflammatory molecules.[141]

1.9.3. Alkaloids

The isoquinoline, quinoline and indole alkaloids are the most studied classes for anti-inflammatory activity.[142] Berberine is one of the main components of *Coptis chinensis*, which is often used in Chinese herbal medicines to treat inflammatory reactions.[143] Warifteine is a potential anti-allergic and anti-inflammatory molecule.[144] The quinolizidine alkaloids matrine and oxymatrine exhibited in vitro cyclooxygenase inhibition and antioxidant activity.[145] Indole alkaloids, such as brucine and brucine-N-oxide, showed significant analgesic and anti-inflammatory properties and inhibited the release of PGE_2 in inflammatory tissue.[146]

1.9.4. Organosulfides

Allicin is found in garlic and shows cardio-protective, anti-carcinogenic, antioxidant and anti-inflammatory activity.[64, 147] In a study, allicin not only significantly inhibited the TNF-α, IL-1β, INF-γ, IL-6, and IL-12 but also showed the ability to promote the secretion of IL-4 and IL-10.[64] Sulforaphane is a phytochemical commonly found in broccoli, brussels sprouts, and cabbages.[148] Sulforaphane possesses antiproliferative, anti-inflammatory, antioxidant and anti-cancer activities. Increases in serum TNF-α, IL-6 and IL-10 were significantly reduced in a study after the use of sulforaphane.[149]

1.9.5. Amino Acids

L-carnitine (LC) is an essential compound that is synthesized from lysine and methionine and found in red meat, codfish, avocado, and nuts.[50] LC may have the potential to control inflammation by reducing the main inflammatory cytokines including NF-κB and TNF-α.[150-151] LC can contribute to the antioxidant defenses in different ways such as direct free radical scavenging, chelating transition metal ions such as Fe and Cu, inhibiting ROS-generating enzymes etc.[152]

Glutathione is a tripeptide derived from glutamic acid, cysteine, and glycine and found in avocado, asparagus, broccoli, garlic, and spinach and is a powerful antioxidant.[50, 153]

Melatonin is found in feverfew, almond, cherry, rice, tomato, and ginger.[50] Melatonin has anti-inflammatory and antioxidant activity. Anti-inflammatory actions of melatonin are inhibition of TNF-α release, inhibition of prostaglandins synthesis, down-regulation of COX-2 expression in macrophages, and modulating the NF-κB signaling pathway.[154]

1.9.6. Vitamins and Minerals

The three main carotenoid (A vitamins) compounds found to be anti-inflammatory are lycopene, β-Carotene, and lutein.[50] Vitamin C (ascorbic acid) is present in citrus fruits, papayas, strawberries, cantaloupes, kiwi, bell peppers, broccoli, and cauliflower.[50] In one study, vitamin C was shown to reduce plasma levels of inflammatory mediators of TNF-α and IL-6 by down-regulation of hepatic mRNA expression.[155] Vitamin C indicates that is a potent antioxidant that inhibits ROS.[156] Vitamin E is present in nuts, oils, green vegetables, tomatoes, olives, sweet potato, papayas, pumpkins, and mangoes.[50] Vitamin E shows both anti-inflammatory and antioxidant effect. Vitamin E decreases the production of IL-1β, IL-6, and TNF-α in the colonic tissue and is also an important free radical scavenger and antioxidant that protects cellular membrane lipids from peroxidation.[157]

Anti-inflammatory and antioxidant minerals are boron (apple, banana, bean, peanut), copper (sesame seed, cashew, mushroom, barley), selenium (tuna, cod, poultry, eggs), and zinc (oyster, meat, egg, raisin bran, yogurt).[50] Boron inhibits the TNF-α, IL-

1, and IL-2 from macrophages and is potent inhibitors of both prostaglandin cyclooxygenase and 5'-Lipoxygenase activities of human leukocytes and mouse macrophages.[158] The antioxidant effect of copper is to decrease lipid peroxidation and cell destruction. The amount of antioxidant enzymes such as superoxide dismutase, catalase and glutathione peroxidase decreases in the lack of copper, so the body's antioxidant defense system collapses.[97] Selenium takes part in the antioxidant defense system of the cell and may downregulate the NF-κB pathway by modulating selenoprotein genes expression.[159]

Zinc decreases NF-κB activation and its target genes such as TNF-α, IL-1β.[160] Zinc is an antioxidant which very effective in reducing ROS.[160]

1.10. Objectives of the Thesis

The first objective of the thesis was to identify the biological pathways that are involved in Behcet's disease etiopathology by a thorough literature search of published genetic studies. The genes and their variants with the major contribution to Behcet's disease were identified, and they were categorized by the biological pathways that they function in. Because Behcet's disease is distributed unevenly among the world populations and shows geographic specificity, the distribution of the identified genetic variants were compared between different world populations. After a list of genes with their variants was made, the genetic variants were ranked based on their effect on Behcet's disease, and degree of differentiation between world populations.

Based on the results of the first objective IL-10 gene was chosen for further study because it had a significant effect on Behcet's disease, and was able to differentiate high-risk Behcet populations from others. Moreover, Behcet's disease is an inflammatory disease resulting from an overactive immune response, and IL-10 is the major anti-inflammatory cytokine that (down) regulates the immune system. Therefore the second objective of the thesis was to investigate the genetic changes and gene expression in IL-10 and its primary receptor IL-10R1.

The third aim of the thesis was to discover novel functional foods or ingredients with high anti-inflammatory properties. It was hypothesized that nutrients with anti-inflammatory properties may help alleviate the symptoms of patients with Behcet's

disease. Therefore, anti-inflammatory natural foods were classified according to their chemical compounds and it was aimed to help patients with their diets.

CHAPTER 2

MATERIALS AND METHODS

2.1. Human Samples

Blood samples were collected from 10 healthy controls and 20 patients with Behçet's disease. The diagnosis of Behçet's disease was made by clinical, laboratory, endoscopy and histopathological examination according to the international guidelines (e.g. International Study Group (ISG) [24] and International Team for the Revision of the International Criteria [26] for Behçet's Disease) in Rheumatology Department of Dokuz Eylül University.

All blood samples were collected into EDTA blood collection tubes, and the blood samples were frozen immediately after collection and kept at -20 °C until molecular experiments.

2.2. Identification of Behcet's Disease Associated Genes and Their Variants

A literature search of the genetics of Behcet's disease susceptibility was conducted in Pubmed (https://www.ncbi.nlm.nih.gov/pubmed/) with the keywords "Behcet's disease", "Behcet syndrome", "gene", "SNP", "variant", and "genetics" covering years 1980-2017. Only original research articles where sample size, investigated genes and their variants, and their statistical association with Behcet's disease reported were further evaluated. In total 77 articles were chosen for analyses. BD associated genes were classified based on the pathway, biological process, and protein class. Genetic variants were classified based on the nature of change (i.e. coding, non-coding) and allelic state (ancestral vs. derived). Individual genes, gene groups, and their biological pathways were identified. Population frequencies of BD

associated variants were extracted from the 1000 Genomes database (http://www.internationalgenome.org/).

Statistical analyses compared the distribution of genes among biological processes and pathways (as implemented in Panther Geneontology database (http://www.pantherdb.org/)); allelic states and nature of change of the variants; and geographic and population-specific distribution of variants.

2.3. RNA Isolation

The Total RNA Mini Kit (Blood/Cultured Cell) from Geneaid (Taiwan) company was used for RNA isolation.

2.3.1. RNA Isolation Preparation

Firstly fresh human blood was collected in anticoagulant-treated collection tubes. 1 ml of RBC Lysis Buffer and 300 µl of whole human blood were added to a sterile 1.5 ml microcentrifuge tube and mixed by inversion. Then the tube was incubated on ice for 10 minutes. The supernatant was completely removed after centrifugation at 3,000 x g for 5 minutes. 400 µl of RB Buffer and 4 µl of β-mercaptoethanol (Sigma-Aldrich, St. Louis) were added. The cells were resuspended by pipetting then incubated at the room temperature for 5 minutes. 400 µl of 70 % ethanol (Sigma-Aldrich, St. Louis) prepared in ddH_2O (RNase and DNase-free) was added, then the mixture was shaken, any precipitate was separated by pipetting as much as possible. The RB Column was placed in a 2 ml Collection Tube and 500 µl of the mixture was transferred to the RB Column. It was centrifuged at 16,000 x g for 1 minute then the flow-through was discarded. The remaining mixture was transferred to the same RB Column then centrifuged at 16,000 x g for 1 minute. The flow-through was discarded and the RB Column was placed in a new 2 ml Collection Tube. 400 µl of W1 Buffer was added into the RB Column then centrifuged at 16,000 x g for 30 seconds. The flow-through was discarded then the RB Column was placed back in the 2 ml Collection

Tube. Then 600 µl of Wash Buffer with ethanol was added into the RB Column. It was centrifuged at 16,000 x g for 30 seconds then the flow-through was discarded. The RB Column was placed back in the 2 ml Collection Tube and centrifuged at 16,000 x g for 3 minute to dry the column matrix. The dried RB Column was placed in a clean 1.5 ml microcentrifuge tube. 50 µl of RNase-free Water was added into the center of the column matrix then standed for at least 1 minute to ensure the RNase-free Water was absorbed. Lastly it was centrifuged at 16,000 x g for 1 minute to elute the purified RNA.

2.3.2. Determination of RNA Concentrations

Concentration and purity of isolated RNAs prior to cDNA synthesis was determined by Nanodrop. The absorbance at 260 and 280 nm wavelength was measured. It is expected that the absorbance ratio of A260 / A280 of ideal high purity quality RNA is 1.8-2.0.

2.4. cDNA Synthesis

The iScript cDNA Synthesis Kit from BioRad (USA) company was used for cDNA synthesis. 20 µl reaction mixture consisted of 4 µl 5x iScript Reaction Mix, 1 µl iScript Reverse Transcriptase, 3 µl Nuclease-free water, and 12 µl RNA template (total RNA concentration was adjusted 1000 ng for each sample). Then it was incubated the complete reaction mix in a Thermal Cycler using the following protocol: 25°C for 5 min of priming, 46°C for 20 min of reverse transcription, 95°C for 1 min of RT inactivation and for optional step hold at 4°C. The resulting cDNAs were ready for Real-Time PCR and stored at -20°C.

2.5. PCR

PCR is a sensitive analysis that allows the amplification of a specific DNA fragment from a complex DNA pool. PCR can be performed using DNA from various tissues and organisms including peripheral blood, skin, hair, saliva and microbes.[161]

2.5.1. Primer Design

Gene sequences for human IL-10 (https://www.ncbi.nlm.nih.gov/gene/3586) and IL-10R1 (https://www.ncbi.nlm.nih.gov/gene/3587) was downloaded from NCBI. Primers for the IL-10 and IL-10R1 mRNAs were designed by PRIMER3 (http://primer3.ut.ee/) program. Designed primers were synthesized by Macrogen (Korea) (Table 2.1.).

Table 2.1. Primers for PCR

Genes	**Primer**		**Primer sequence**	**Product Length (bp)**
IL-10	Forward		CTGAGCTTCTCTGTGAACGAT	665
	Reverse		ACTGCAACTTCCATCTCCTG	
IL-10R1	Pair 1	Forward	TAGTGCAGGGTATGTGGGTG	769
		Reverse	CTCTGGGTCTGTAGCTGGAC	
	Pair 2	Forward	GGCCTCAATCTCCCATCTGT	713
		Reverse	TTCCTCAGCAGAACCTCACA	

2.5.2. PCR Preparation

FastStart High Fidelity PCR System, dNTPack from Roche Applied Science (Germany) company was used for PCR. Firstly the reagents were thaw and stored on ice. All reagents were vortexed and centrifuged before setting up the reactions. For each 25 µl reaction, components consisted of 17.75 µl water (ddH_2O), 2.5 µl reaction buffer

(10x), 0.5 µl DMSO, 0.5 µl PCR grade nucleotide mix, 1 µl downstream (forward) primer, 1 µl upstream (reverse) primer, 1.5 µl cDNA, 0.25 µl enzyme blend and they were put to a sterile reaction tube on ice. The reaction was mix thoroughly and each 25 µl reaction put into 0.2 ml PCR tubes. Then analysis was run with the Applied Biosystems SimpliAmp^{TM} Thermal Cycler. The PCR protocol was as follows: 95°C for 2 min of initial denaturation followed by 35 cycles of 30 sec denaturation at 95°C, 30 sec annealing at 56°C, and 50 sec elongation at 72°C, and final elongation step at 72°C for 5 min, and cooling step hold at 4°C. The samples were put in the freezer after cycling.

2.6. Agarose Gel Electrophoresis

Agarose gel electrophoresis is a standard method for the differentiation, identification, purification of DNA molecules. The electrophoretic analysis is based on the principle that the molecules dissolved in the environment migrate according to their electrical charges in an electrical field. Since DNA molecules are negatively charged due to free phosphate groups, they move from cathode to anode on the gel. Large molecules have difficulty walking on the gel, while small molecules can move more quickly and comfortably.

Agarose density: Depending on the size of the PCR sample studied, agarose gel electrophoresis is performed by determining the desired agarose density. Agarose is usually used in concentrations ranging from 0.8% to 1.2%. Recommended agarose gel concentration for the separation of linear DNA molecules was shown in Table 2.2.

Table 2.2. Recommended agarose gel concentration for the separation of linear DNA molecules

% Agarose	DNA size range (bp)
0,75	10.000-15.000
1,00	500-10.000
1,25	300-5000
1,5	200-4000
2,00	100-2500
2,5	50-1000

2.6.1. Buffer Solution Preparation

The most commonly used buffer solutions in agarose gel electrophoresis are Tris-acetate (TAE) and Tris-Borate (TBE). These buffers may be purchased commercially or prepared as concentrated solutions in the laboratory. The 50X TAE to be used in the experiment was purchased commercially. When preparing 1X from a buffer solution in the main stock at 50X; 20 ml of 50X Main Stock is added to 980 ml of pure water.

2.6.2. Agarose Gel Preparation

0.8 % agarose gel was prepared for agarose gel electrophoresis. Firstly 0,8 g agarose was weighed and put in Erlenmeyer. 100 ml 1X TAE buffer solution was added. The prepared mixture was heated in a microwave oven until no particules remain. Then left to cool for a while. 1 µl GelRed® Nucleic Acid Gel Stain dye was added into slightly cooled agarose and mixed.

Note: The dye added at this stage shows the fluorescence effect under UV light and makes the molecule studied visible on the gel. Ethidium bromide is a strong carcinogen and toxic so the GelRed dye is used as an alternative.

The agarose was poured into a gel tank in which the combs are placed. Then allowed to solidify at room temperature. Once solidified, it was placed in the gel box.

2.6.3. Loading Samples and Running an Agarose Gel

1X TAE Buffer solution was used to fill the gel box until the gel was covered. Once the gel was completely solid, the bands were carefully removed and placed in the gel tank. Care was taken that the buffer solution remains at the top of the gel. Then the comb was removed from the gel. 6 µl 100 bp DNA Ladder (Geneaid, Taiwan) was loaded into the first well then 1 µl 6x dye and 5 µl sample were loaded. The gel was run

at 100 V for 70 minutes with Major Science Safeblue Electrophoresis System. At the end of the run, the electric current was closed and the gel was placed under UV light (Uvitec, UK) for visualization.

2.7. Real-time PCR (qPCR)

Quantitative real-time PCR provides information beyond just detection of DNA. Indicates how much of a particular DNA or gene is present in the sample. qPCR allows both the detection and measurement of the PCR product in real-time as it is synthesized.[161]

2.7.1. Primer Design

The primers used for the IL-10, IL-10R1 and ACTB gene regions were specifically designed for Homo sapiens using NCBI and ENSEMBLE gene banks. The specificity of the designed primers was controlled by the BLAST program. Primers were synthesized by Macrogen (Korea).

Table 2.3. The primers used for real-time PCR analysis

Genes	Primer	Primer sequence
IL-10	Forward	TCTCCGAGATGCCTTCA
	Reverse	CATGGCTTTGTAGATGCCTTTC
IL-10R1	Forward	TTCACGTTCACACACAAGAAAGT
	Reverse	CAGAACTCTCCCACTTCTCCA
ACTB	Forward	TCTACAATGAGCTGCGTGTG
	Reverse	GGTCTCAAACATGATCTGGGT

2.7.2. Optimization for Primers

The primers are diluted to 100 µM (i.e. 100 pmol / µl) by adding the required amount of water depending on their molecular mass. Working stock solutions (explained below) were prepared and made ready for Real-Time PCR analysis.

2.7.3. Primer Working Stock Solution Preparation

A 10 µM intermediate stock was prepared from Forward and Reverse primers. For this, 10 µl was taken from 100 µM main stock and 90 µl of water was added.

*When preparing intermediate stocks, the classical formula M1 * V1 = M2 * V2 was used.*

Where M1 and V1 are the molarity and volume of the stock solution, respectively, and M2 and V2 are the molarity and volume of the working solution.

2.7.4. Real-Time PCR (qPCR) Preparation

The synthesized cDNAs were run with the Roche Light Cycler 480 II instrument using the Light Cycler® 480 SYBR Green I Master (Roche Applied Science, Germany) with the primers designed for the indicated gene regions (Table 2.3.). The ACTB gene indicated in the study was taken as the reference (control) gene. Together with the IL-10 and IL-10R1 genes were prepared and loaded into the device. Each 7,5 µl reaction mixture consisted of 1.9 µl water (PCR-grade), 0.3 µl forward primer, 0.3 µl reverse primer, 5 µl enzyme mixture (Light Cycler® 480 SYBR Green I Master).

7,5 µl Reaction Mix + 2,5 µl cDNA = 10 µl Total Reaction Volume

In the reaction tube, each of the components (except cDNA) was added to a single reaction and multiplied by the number of reactions to prepare the reaction mixture. For each reaction, 7.5 µl of the reaction mixture was transferred to the plates.

A 2.5 µl cDNA sample was added to each well to give a final reaction volume of 10 µl. Prepared plates were covered and centrifuged with a plate centrifuge. The study was carried out with the device protocol shown in Table 2.4.

The expression of three genes (IL-10, IL-10R1, ACTB) were analysed in duplicates for all samples via Real-Time PCR (qPCR) analysis.

Table 2.4. Real-Time PCR (qPCR) Protocol

Program Name	**PRE-INCUBATION**	**AMPLIFICATION**			**MELTING CURVE**			**COOLING**
Analysis Mode	None	Quantification Mode			Melting Curve Mode			None
Number of Cycles	1	45			1			1
Target Temperature [°C]	95	95	57	72	95	62	97	40
Time	00:05:00	00:00:10	00:00:15	00:00:10	00:00:05	00:01:00	00:00:00	00:00:30
Temperature increase rate [°C/s]	4,8	4,8	2,5	4,8	4,8	2,5	0,11	2,5
Reading Mode	None	None	None	Single	None	None	Continuous	None

2.7.5. Analysis

The data which contains Ct values were obtained at the end of Real-Time PCR analysis from Roche Light Cycler 480 software using Absolute Quantification and Advanced Relative Quantification analyses methods. ΔΔCt method was used to make Relative Quantification of gene expression in the obtained results. Target gene Ct values were normalized with ACTB by this method. Normalized values were compared with control groups and Fold Change values were found.

ΔΔCt method uses these steps [162] :

Step1: ΔCt values were obtained for both patients and controls.

ΔCt = Ct target – Ct reference

Step 2: ΔΔCt values were obtained.

ΔΔCt values: ΔCt patient sample – ΔCt control sample

Step 3: Fold Change Expression = $2^{-\Delta\Delta CT}$ values were obtained.

Fold change expression is interpreted as follows: If it is greater than 2, then it means significant up-regulation of the target gene. If it is lower than -2, then it means significant down-regulation of the target gene. If it is between -2 and 2, then it means non-significant of the target gene.

2.8. DNA Sequencing

DNA sequencing is based on the chain termination method, where nucleotides in a single-stranded DNA molecule are determined by the complementary synthesis of polynucleotide chains, based on the selective incorporation of chain-terminating dideoxynucleotides driven by the DNA polymerase enzyme.[163]

2.8.1. DNA Sequencing Analysis

Purification of PCR products

The obtained PCR products were purified using EXOSAP. 2 µl of EXOSAP was added to 5 µl of PCR product and kept for 30 minutes at 37 °C and 15 minutes at 85 °C.

Sequencing of purified PCR products

The sequencing PCR will be established from the purified PCR products obtained after purification. A reaction mixture for 1 amplification tube (12 µl) consisted of : 1 µl BigDye Ready Reaction Mix, 0.5 µl primer (3.2pmol/µl), 4 µl distilled water, 2 µl 10x buffer , 2 µl Dye saving, 2.5 µl purified PCR products. The PCR amplification was as follows: 25 cycles of 10 sec at 96 °C, 5 sec at 50 °C, 4 min at 60 °C.

Purification after sequencing PCR

Sequencing PCR products obtained were cleaned with Zymogen DNA Sequencing Clean - Up Kit. Firstly 200 µl of DNA Binding Buffer was added onto 10 µl of PCR product. The prepared mixture was transferred to Zymo-spin column and it was centrifuged at 10,000 x g for 60 sec. The flowing liquid was removed from the tubes and 200 µl of Wash Buffer was added to the column and centrifuged again at 10,000 x g for 60 sec. Finally, the Zymo-spin column was transferred to a new clean tube and 20 µl of distilled water was added and centrifuged at 10,000 x g for 60 sec. The filtered Sequencing PCR product was loaded and run on the ABI Prism 3100.

Analysis of DNA sequence results

Nucleotide sequence chromatograms were visualized, examined, and aligned with Unipro UGENE (http://ugene.net/) [164]. Specifically, ClustalW was used to align DNA sequences.

2.9. Statistical Analysis

Geographic and population-specific distribution of frequencies of Behcet related variants reported in literature among the 1000 Genome database (http://www.internationalgenome.org/) was examined with principal component analysis. Distribution of IL-10 and IL-10R1 genetic variants between Behcet patients and controls were tested with Chi-square test. IL-10 and IL-10R1 gene expression levels were compared between Behcet patients and controls by parametric T-tests, and non-parametric Kruskal-Wallis tests.

All statistical analyses were conducted in R (https://www.r-project.org/). P-values less than or equal to 0.05 were considered statistically significant.

2.10. Project Funding

This thesis is funded by TUBITAK project number 116C090, and İzmir Institute of Technology BAP project number 2016IYTE40.

CHAPTER 3

RESULTS AND DISCUSSION

3.1. Behçet's Disease Associated Genes, Their Variants, and Related Pathways

Out of 77 articles, 119 genes and 241 variants (SNPs) were reported to be significantly associated with Behcet's disease (Appendix A). Most significantly associated genetic variants were involved in antigen processing and presentation (such as HLA), and interleukin signaling pathways. However, for several genes (such as PSORS1C1, POU5F1, and CCHCR1) that were reported to be significantly associated with Behcet's disease, no biological information was available. Sixty-three percent (153 out of 241) of the variants were reported to increase susceptibility to Behcet's disease.

3.2. Distribution of Behcet's Disease Associated Variants among World Populations

Population frequencies of the 237 variants were calculated in African (7 populations), Ad Mixed American (4 populations), East Asian (5 populations), European (5 populations), and South Asian (5 populations) populations based on 1000 Genome data (Table 3.1, Appendix B).

A principal component analysis was performed on the constructed genetic variant frequency matrix of populations. Differentiation of populations along the most informative top three principal components (PC) was visualized (Figure 3.1 and 3.2).

The first PC differentiated Africans from the rest of the populations. SMARCA, IL23R, SAMD3, EBF2 had the highest loading on the first PC, indicating large frequency differences of genetic variants between African populations and others.

Table 3.1. Country names and abbrevations of the 1000 Genome populations

AFR	**African**
ACB	African Caribbeans in Barbados
ASW	Americans of African Ancestry in SW USA
ESN	Esan in Nigeria
GWD	Gambian in Western Divisions in the Gambia
LWK	Luhya in Webuye, Kenya
MSL	Mende in Sierra Leone
YRI	Yoruba in Ibadan, Nigeria
AMR	**Ad Mixed American**
CLM	Colombians from Medellin, Colombia
MXL	Mexican Ancestry from Los Angeles USA
PEL	Peruvians from Lima, Peru
PUR	Puerto Ricans from Puerto Rico
EAS	**East Asian**
CDX	Chinese Dai in Xishuangbanna, China
CHB	Han Chinese in Bejing, China
CHS	Southern Han Chinese
JPT	Japanese in Tokyo, Japan
KHV	Kinh in Ho Chi Minh City, Vietnam
EUR	**European**
CEU	Utah Residents (CEPH) with Northern and Western European Ancestry
FIN	Finnish in Finland
GBR	British in England and Scotland
IBS	Iberian Population in Spain
TSI	Toscani in Italia
SAS	**South Asian**
BEB	Bengali from Bangladesh
GIH	Gujarati Indian from Houston, Texas
ITU	Indian Telugu from the UK
PJL	Punjabi from Lahore, Pakistan
STU	Sri Lankan Tamil from the UK

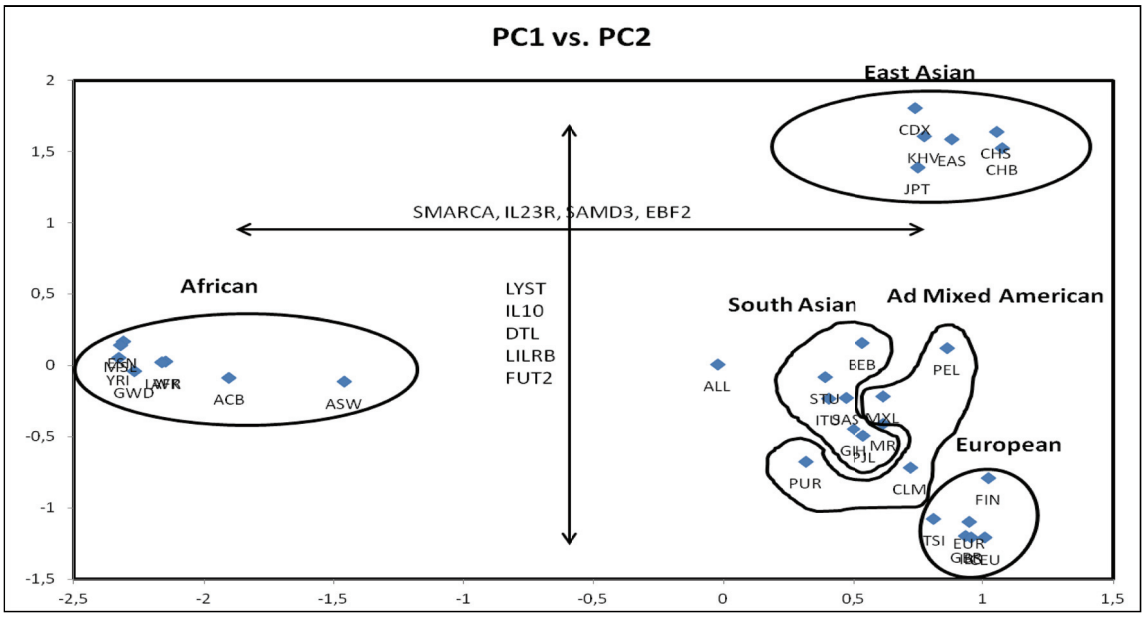

Figure 3.1. Seperation of 1000 Genome populations (Table 3.1) along the top 2 principal components (PC). Genes with the largest contributions on the respective PCs are listed on the axes.

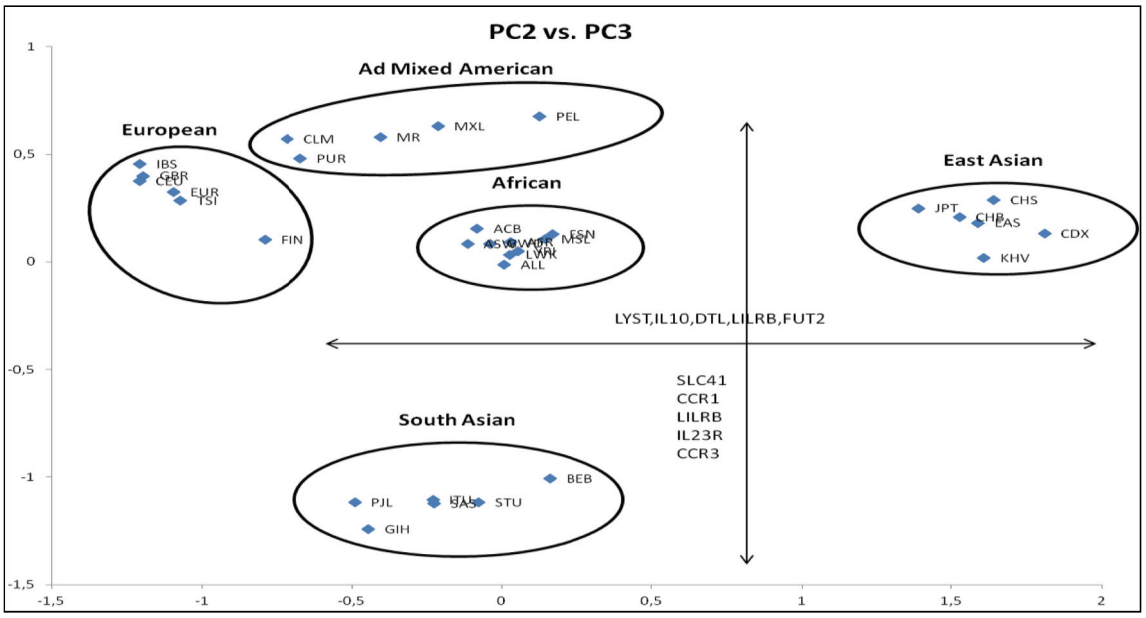

Figure 3.2. Seperation of 1000 Genome populations along PC2 vs. PC3. Genes with the largest contributions on the respective PCs are listed on the axes.

LYST/NID1, IL-10, DTL, LILRB1, FUT2 had the highest loading on the second PC, indicating large frequency differences of genetic variants between East Asians and others. Because Behcet's disease prevalence is high in East Asians, the genetic variants that have the highest loading on the second PC were investigated further (Table 3.1). Of the genes that show high differentiation between East Asians and others, IL-10 was reported to have the most significant association with BD. Moreover, IL-10 was the most thoroughly studied gene in the list and had the most biological pathway related information (Table 3.2).

Therefore rest of the genetic studies of this thesis focused on IL-10, and its primary receptor IL-10R1.

Table 3.2. Genes and variants with high contribution to the second principal component (PC2) that differentiates East Asians from other groups

Biological Pathway	**Gene**	**Variant/SNP**	**Type**	**Behcet Allele**	**Effect on BD**	**OR**	**P Value**	**Loading[a]**

a. Loading scores of Behcet related genes on the second principal component (PC)

3.3. IL-10 and IL-10R1 Gene Expression Results

Total RNA was isolated from the 30 blood samples. Over 95% of the samples had at least 30 ng/ µl RNA and all samples had high quality (high purity) RNA (Figure 3.3 and 3.4).

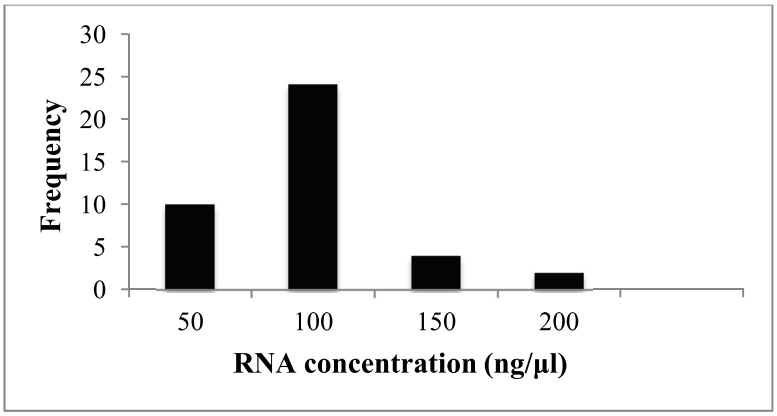

Figure 3.3. RNA concentration of samples

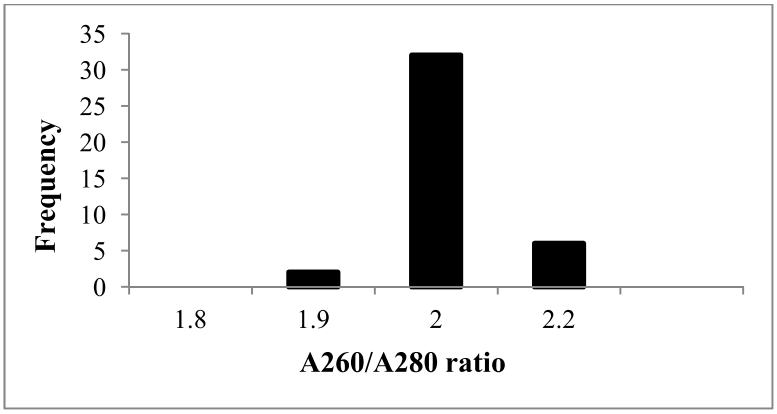

Figure 3.4. Quality of extracted RNA samples

After cDNA construction, IL-10, IL-10R1, and ACTB gene (control gene) expressions were carried out. Successful gene expression was detected for all genes and all samples (Figure 3.5-6-7).

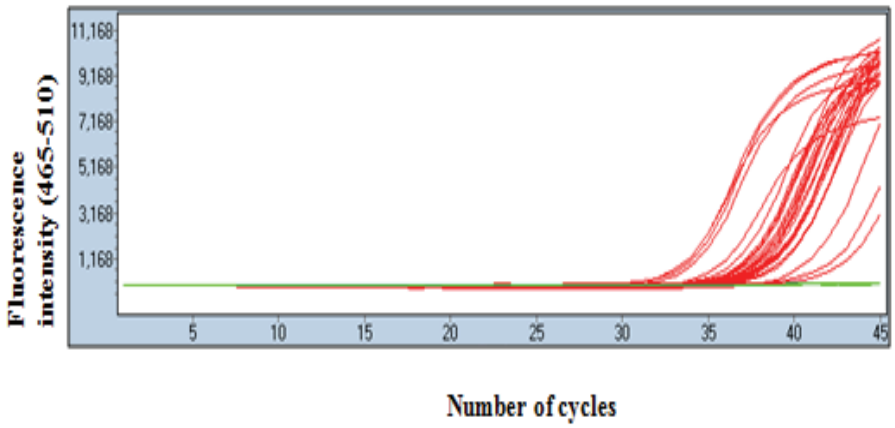

Figure 3.5. Amplification curves of IL-10

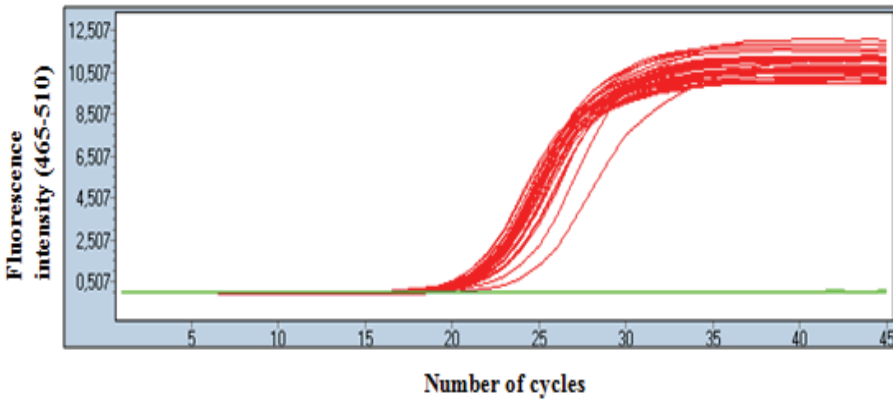

Figure 3.6. Amplification curves of IL-10R1

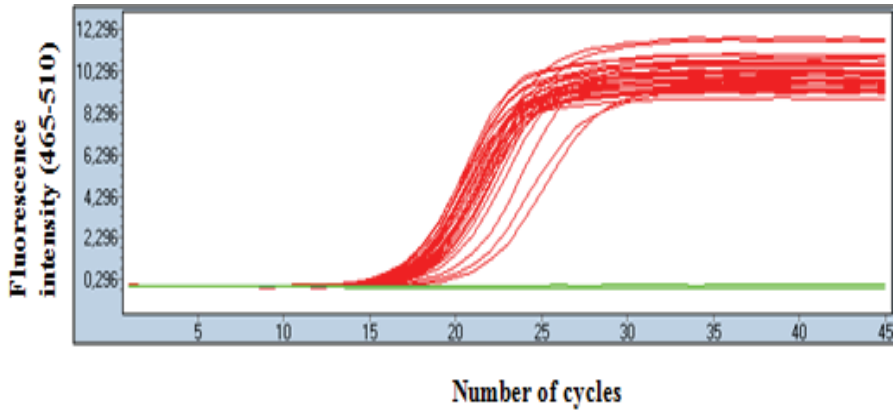

Figure 3.7. Amplification curves of ACTB

IL-10 gene expression was 9.6 fold higher in Behcet patients compared to normal controls (Figure 3.8), whereas IL-10R1 expression was not statistically different between the two groups (means 0.8 vs 0.9, fold change=0.9) (Figure 3.9). Gene expression levels are standardized with respect to the mean of the control group.

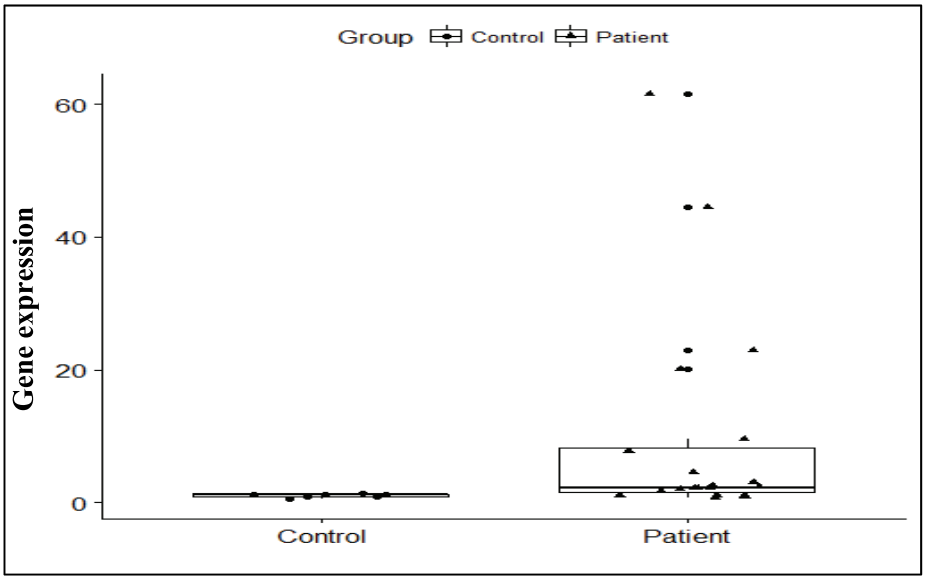

Figure 3.8. Comparison of IL-10 gene expression between Behcet patients and controls

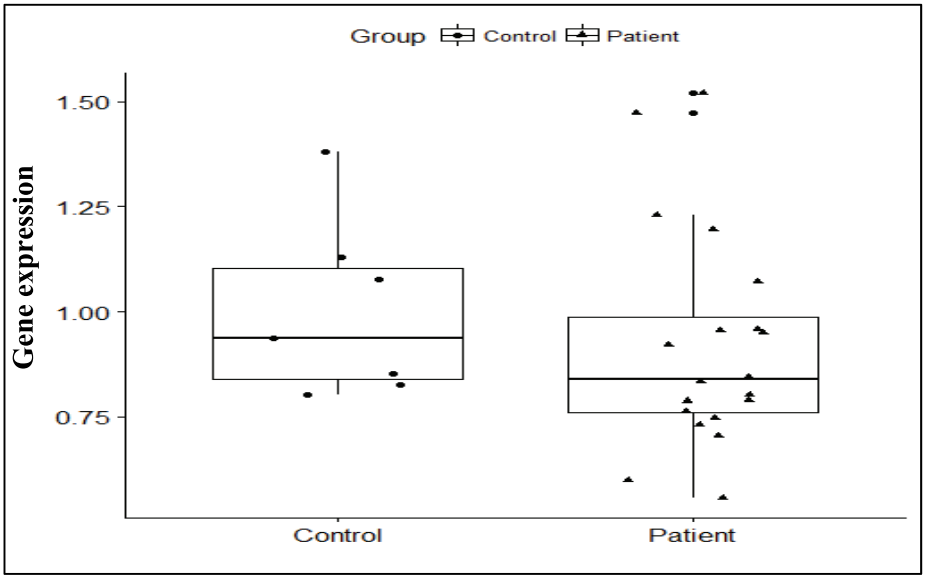

Figure 3.9. Comparison of IL-10R1 gene expression between Behcet patients and controls

3.4. IL-10 and IL-10R1 Gene Sequencing Results

The 800 base-length portion of the 1630 base-length IL-10 mRNA and 1700-base portion of the 3672 base IL-10R1 mRNA were successfully sequenced. Sequence steps and results were further illustrated in Figure 3.10., and Figure 3.11.

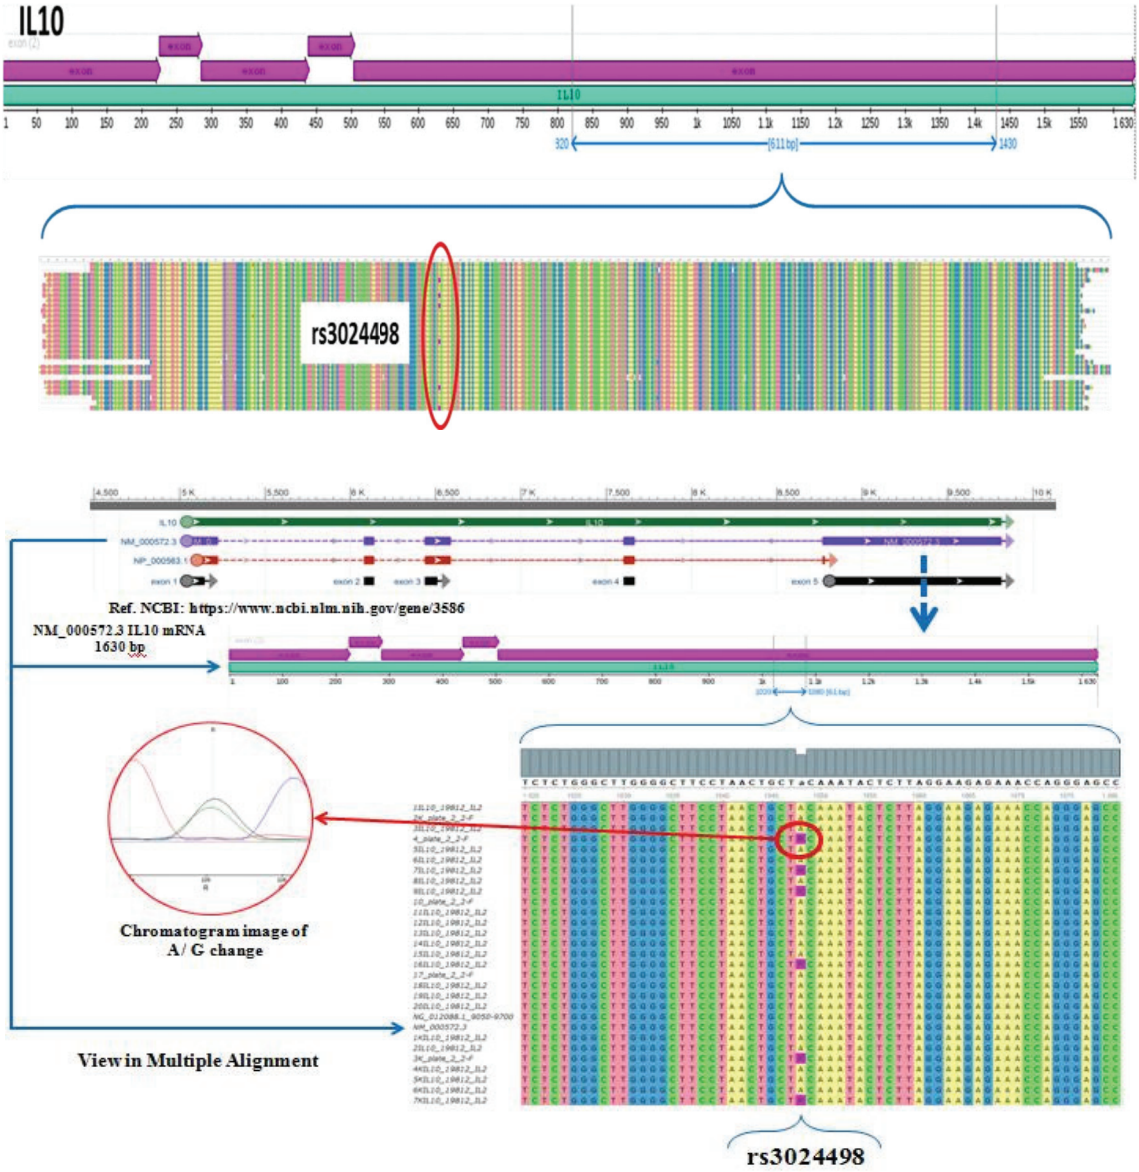

Figure 3.10. Sequencing of the IL-10 gene encoding (exon) portions over the mRNA and results

The IL-10 gene and the mRNA sequence were taken from the NCBI database (NM_000572.3), divided into two regions for mRNA sequencing and primers were

designed. The resulting DNA sequences were aligned with the ClustalW program, and visualized by the UGENE program. The Figure 3.10. shows the final exon portion (exon 5) of IL-10 with rs3024498 SNP.

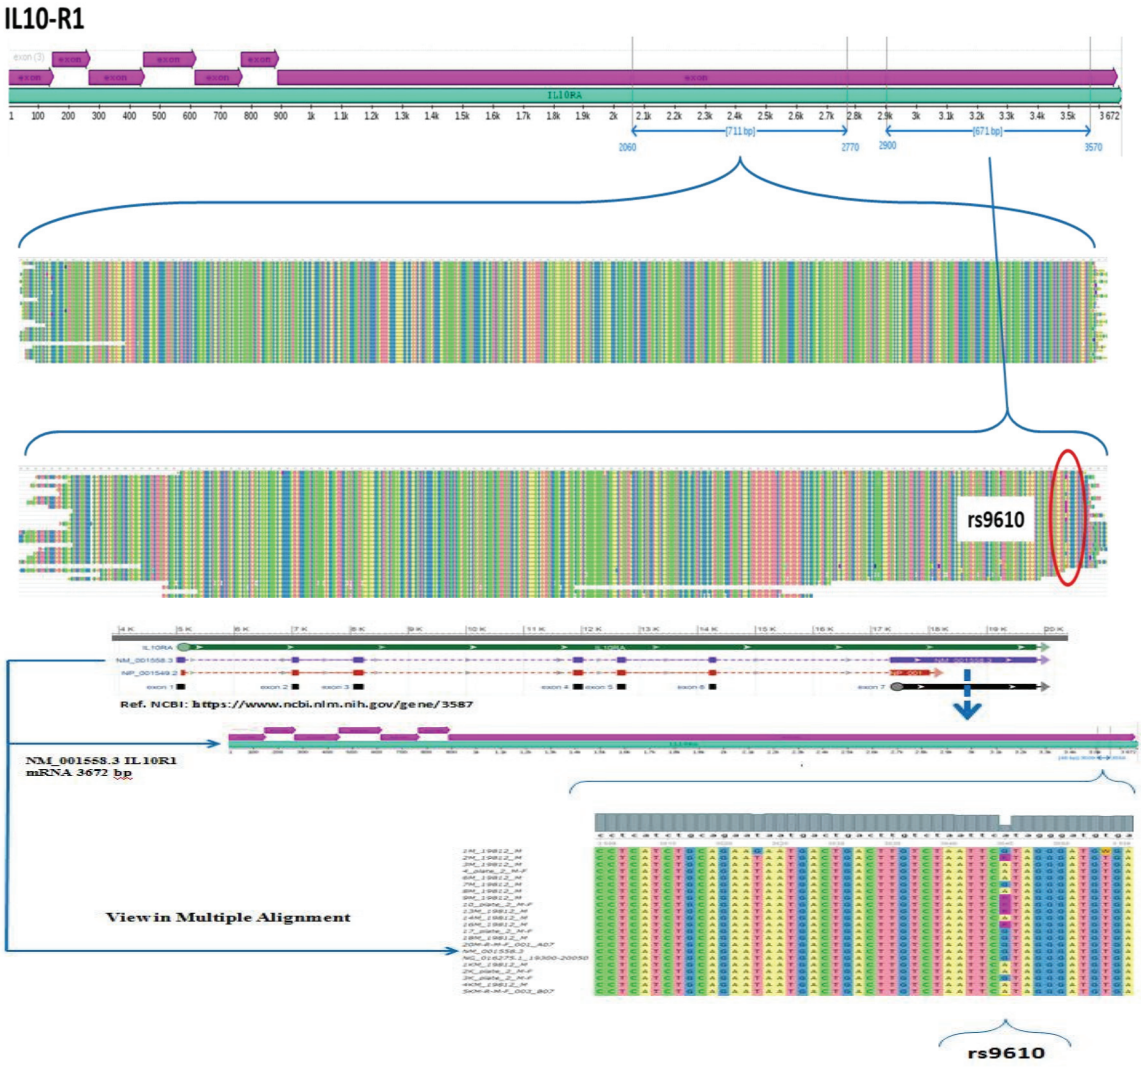

Figure 3.11. Sequencing of the IL-10R1 gene encoding (exon) portions over the mRNA and results

The IL-10R1 gene and the mRNA sequence were taken from the NCBI database (NM_001558.3), divided into five regions for mRNA sequencing and primers were designed. The resulting DNA sequences were aligned with the ClustalW program and visualized by the UGENE program. The Figure 3.11. shows the final exon portion (exon 7) of IL-10R1 with rs9610 SNP.

One polymorphic base was found for both genes as a result of IL-10 and IL-10R1 sequencing. As a result of bioinformatics analysis of the sequences around the

polymorphic bases in the NCBI, dbSNP, 1000 Genome and Ensembl databases, it was determined that the polymorphism in the IL-10 gene was rs3024498 (A / G) and the polymorphism in the IL-10R1 gene was rs9610 (A / G). Table 3.3. shows the distribution frequency of both polymorphisms in patient and control samples. It is a 3 'UTR variation in the last part of the mRNA in both variations and does not cause any amino acid change.

Linkage disequilibrium can confound genetic association signals. Therefore variants that show linkage disequilibrium with the rs30244988 and rs9610 are calculated with the LDproxy program (https://ldlink.nci.nih.gov/?tab=ldproxy).[165] Twelve and five variants that show $R^2 \geq 0.5$ with rs3024498 and rs9610, respectively, using the European populations of the 1000 genomes data were found (Appendix C). Most of these variants were found to be either in upstream or downstream of IL-10 or IL-10R1. Few of them were also in close proximity to other genes such as IL-19 and SMIM35. Follow-up studies can focus on these genes to evaluate their potential effect on BD.

Table 3.3. Distribution frequency of rs3024498 and rs9610 variation in patient and control samples

	IL-10 rs3024498 G allele frequency (%)	IL-10R1 rs9610 G allele frequency (%)
Patient (n=20)	10	50
Control (n=10)	14	18
Total (%)	11	41
P[a]	0.49	0.08

[a]Chi-square (2x2) statistical test result which tests the distribution of alleles in patient and control groups

Although there was no statistically significant difference in the distribution of both polymorphisms between patients and control groups, it was seen that rs9610-G allele was more prevalent in the patient group. A power and sample size calculation showed that in order to show a significant association between rs9610 and BD at alfa 0.05 probability and 80% power, 39 cases and 39 controls are needed. As a result rs9610 variant can be a genetic change that increases the risk of Behçet's disease. Since there were clinical signs of skin and oral aphthae in the patient group, rs9610 may influence the clinical presentations of BD. These findings should be tested with larger sample groups.

Neither the rs3024498, nor the rs9610 variant did not have a significant effect on gene expressions ($p > 0.6$).

3.5. Discussion

There are over 100 genes that were reported to contribute to BD risk from diverse populations. These analyses of distribution of BD associated variants among world populations showed that there is a big population differentiation between the world populations with respect to BD risk alleles where populations with high frequencies of BD, such as the East Asian populations, were rather different in terms of BD risk allele variant frequencies from other world populations. This observation supports the idea that BD has a substantial genetic component and these genetic components can be rather population specific.

IL-10 gene was identified as one of these genetic risk factors that strongly influenced the differentiation of high-risk BD populations from others and these molecular genetic analyses were continued with IL-10 and its primary receptor IL-10R1 in a Turkish BD cohort.

The sequencing results identified only a single variant both in the IL-10 and IL-10R1 genes. The IL-10 rs3024498 variant is not associated with Behcet's disease in this study. This observation is in agreement with Montes-Cano et al., where the allele frequency of IL-10 rs3024498 variant was not significantly different between 304 BD patients, and 313 Spanish matched controls. [166] In another study, Xavier et al. looked at the effect of this variant in 973 Iranian patients with BD and 637 non-BD controls and did not observe a significant effect. [167]

However, this SNP has been found to be associated with active pulmonary tuberculosis in an Indian population [168], colorectal cancer in a US population[169], helminth infection in a Brazilian population [170], gastrointestinal stromal tumours in a US population[171], hepatitis C virus (HCV) clearance in an African American population[172], visceral leishmaniasis in an Indian population [173], systemic lupus erythematosus in a Chinese population [174], motoric cognitive risk syndrome in an Ashkenazi Jewish

population [175], and asthma in Canadian, Australian, US, and Swedish populations [176-177], proliferative vitreoretinopathy across Slovenian and European Subpopulations [178].

The IL-10R1 rs9610 variant showed a marginally significant association with Behcet's disease in this study. Also, Yang et al. reported that IL-10R1 rs9610 polymorphism might contribute to rheumatoid arthritis susceptibility in a Chinese population.[179]

However, this SNP has been found to be associated with cervical squamous cell carcinoma by Hussain et al.[180], non-Hodgkin lymphoma (NHL) overall and B-cell lymphoma by Bi et al.[181], and rubella stimulation by Dhiman et al.[182] in the USA.

There was a significant increase in IL-10 gene expression in Behcet patients compared to the controls in this study. Puccetti et al. [183] also reported a significant increase in IL-10 gene expression in Behcet patients compared to controls in an Italian population.

On the other hand, Alipour et al.[184] and Afkari et al.[185] reported that the expression level of the IL-10 gene was significantly reduced in the Behcet patients group compared to the control group in Iranian population.

Foods and their active anti-inflammatory ingredients were classified according to their effect on the mechanisms of inflammatory processes, such as COX2, NF-κB inhibition (Table 3.4). Very large quantities of foods need to be consumed to deliver the desired effects of their active ingredients. However, this is usually not feasible as the majority of people cannot consume that many vegetables, fruits, nuts or fish. Therefore alternative food supplements need to be developed. Novel food supplements can deliver high quantities of chemical components with anti-inflammatory properties (such as quercetin, boswellic acid, etc.) in a single dosage. Based on their water and oil solubility properties either a tablet or gel capsule formulations can be considered. However, in vitro, in vivo, and controlled clinical trials are necessary to determine the dosage and safe use of the potential supplements.

There are several limitations to the study. Firstly, the patient and control sample size needs to be increased as indicated by the power calculations in the Results section. For gene expression the whole blood was used, however, separate gene expression

analyses of lymphocytes and neutrophils can give a better idea on the role of IL-10 pathway in BD. Finally, only the coding regions of IL-10 and IL-10R1 was sequenced, so the potential influence of regulatory (such as the promoter) and intron region variants were not examined.

Table 3.4. Food ingredients with high anti-inflammatory properties

Active chemical component	**Sources**	**Solubility**	**Mechanism(inhibition)**
Quercetin	Fruit, vegetables, cereals, leguminous plants, fruit juices, tea, wine	It is barely soluble in water. Therefore, it is recommended to consume with bromelain to facilitate absorption.	COX2, NF-κB
Shogaol	Ginger	Soluble in water	COX2, iNOS
Melatonin	Feverfew, almond, cherry, rice, tomato, and ginger	Partially soluble in water and highly soluble in oils.	COX2, TNF-α, NF-κB, PG2
Genipin	The fruit of Gardenia jasminoides Ellis	Soluble in water	iNOS
Boron	Apple, banana, bean, peanut	Soluble in water	COX2, TNF-α, IL-1, IL-2, PG2
Matrine and oxymatrine	*Sophora Flavescens*	Soluble in water	COX2
Hypericin	St. John's wort	Soluble in water	COX- 2, NF-κB
Anthraquinone	Senna fruits, rhubarb root, aloe	Poorly soluble in water	COX2
Resveratrol	Grape, blueberries, peanuts, cranberries, red wines	Soluble in water	COX2, NF-κB

(cont. on next page)

Table 3.4. (cont.)

Active chemical component	Sources	Solubility	Mechanism(inhibition)
Epigallocatechin gallate (EGCG)	Green tea, hazelnut, strawberry, kiwi, cherry	It is recommended to consume with vitamin C, fish oil, and/or black pepper	COX2, PG2
Stilbenes	Cocoa, grape, hop, peanut, strawberry, sugar cane, tomato, bilberry, wines, and berries.	Soluble in water	COX2 TLR4
Zinc	Oyster, meat, egg, raisin bran, yogurt	Poorly soluble in water	NF-κB, TNF-α, IL-1β
Hesperidin	Tomatoes	Soluble in water	COX2, IL-8
Naringenin	Citrus fruit	Soluble in water	COX2,TNF-α, iNOS
PINO	Sesame, Olive oil	Soluble in oil	COX2, IL-6, PGE_2
Boswellik acid	*B. serrata*	Soluble in water	COX2
Curcumin	Turmeric	Poorly soluble in water	COX2, iNOS, TNF-α, IL -1, -2, -6, -8 and -12
Betulinic acid	Tree bark	Soluble in water	NF-κB
Aucubin, catalposide, genipin, α-pinene	Verbena	Essential oil	NF-κB
Selenium	Tuna, cod, poultry, eggs	Soluble in water	NF-κB

(cont. on next page)

Table 3.4. (cont.)

Active chemical component	Sources	Solubility	Mechanism(inhibition)
β -Carotene	Red palm oil, palm fruits, leafy green vegetables, carrots, sweet potatoes, mature squashes, pumpkins, mangoes, and papayas	When combined with beta carotene E and C vitamins, its effect is further increased.	COX2, iNOS, TNF-α, IL-1β, NF-κB
L-carnitine (LC)	Red meat, codfish, avocado, and nuts	Soluble in water	NF-κB, TNF-α
Ginsenosides	Ginseng	Soluble in water	NF-κB
Lycopene	Tomato, watermelon, pink grapefruit, rosehip and papaya	Consumption of lycopene-containing foods together with oil will allow the body to get better lycopene.	NF-κB
Parthenolide	Feverfew	Soluble in water	NF-κB
Pterostilbene	Blueberries	Poorly soluble in water	TNF-α, IL-6, MAPK
Costunolide and Sesquiterpenoids	*Magnolia grandiflora*	Essential oil	NF-κB
Carnosol	Rosemary, ginkgo and various Chinese roots	Soluble in water	NF-κB
Lutein	Green vegetables such as spinach, cabbage but also in egg yolks	It is may be consumed with resveratrol, omega 3, vitamin C, vitamin E, copper, zinc, selenium.	NF-κB
Tanshinone IIA, andalusol, ginkgolides	Rosemary, ginkgo and various Chinese roots.	Essential oil	NF-κB

(cont. on next page)

Table 3.4. (cont.)

Active chemical component	Sources	Solubility	Mechanism(inhibition)
Kaempferol	Broccoli, cabbage, kale, beans, endive, leek, tomato, strawberries, and grapes	Poorly soluble in water	NF-κB
Flavones	Chamomile, parsley, tea, rosemary, oregano, wine, kiwi, spinach, lettuce, broccoli, grapefruit, cereal and legumes	Soluble in water	NF-κB TLR4
Proanthocyanidins	Fruits, vegetables, nuts, seeds, flowers and tree bark	Soluble in water	NF-κB
Gingerol, shogaol	Ginger	Soluble in water	PG2, IL-1, TNF-α, IL-8
Indole alkaloids	Marine sources	Soluble in water	PG2
Lupeol	White cabbage, pepper, cucumber, tomato, olive, fig, mango, strawberry, red grapes, American ginseng, Shea butter plant	Poorly soluble in water	PG2
Ellagic acid and gallic acid	Pomegranate	Slightly soluble in water	PG2, IL-6, iNOS
Salicylic acid	Cranberry juice extract	Poorly soluble in water	PG2

(cont. on next page)

Table 3.4. (cont.)

Active chemical component	Sources	Solubility	Mechanism(inhibition)
Isoflavones	Soybeans, soy foods, and legumes	Soluble in water	IL-1β, IL-6, IL-12, and TNF-α
Vitamin E	Nuts, oils, green vegetables, tomatoes, olives, sweet potato, papayas, pumpkins, and mangoes	Soluble in oil	IL-1β, IL-6, and TNF-α
Allicin	Garlic	It is slightly soluble in water	TNF-α, IL-1β, INF-γ, IL-6, and IL-12
Vitamin C	Citrus fruits, papayas, strawberries, cantaloupes, kiwi, bell peppers, broccoli, and cauliflower	Soluble in water	TNF-α, IL-6
Sulforaphane	Broccoli, cabbage, cauliflower, and kale	Soluble in water	TNF-α, IL-6

CHAPTER 4

CONCLUSION

BD is a complex disease where several genetic and non-genetic factors contribute to disease risk. The results suggest that the major anti-inflammatory cytokine IL-10 pathway may be an important player in BD risk. Clearly other genetic and environmental factors also contribute, and possibly interact with IL-10 pathway modifying its role in BD. Further studies with larger sample sizes and more comprehensive genetic and non-genetic data are essential to understand the etiopathogenesis of BD.

Diet regimens in BD are largely unexplored. BD patients may not benefit from so-called anti-inflammatory foods because they have to consume very large amounts to see potential effects. However, functional foods or other products with high amounts of key anti-inflammatory components that are derived from natural sources may be more useful for BD patients.
